Exercise

From the last exercise (week 10), make the following additions:

New product form validation

- Title is required and must be at least 5 characters long
- Description, price, and category are required. The photo is also required.
- Create a validator for the price and category that checks that the value is greater than 0. Call it **positiveValue**.
 - Convert the value to number in the validator and check if it's not NaN and also greater than (>) 0.
- For title and description fields (**ngModelGroup**) that checks that at least one of them is not empty (call it **oneRequired**).
- For every field in the form, add the class **is-invalid** (Bootstrap) when there's any error. Add the class **is-valid** when it's validated. Only do this if the field has also been visited (touched).
 - Show the corresponding error information below each form field (input, textarea, select,...) when it's been touched and it's still invalid.
- Disable the submit button until the form is valid.

Refactor the application in modules

- **Menú** module: Will have a menu component with the top menu inside (The <nav> element currently inside app.component).
- Products module: All pages, components etc, related to products. With routing module (--routing true). The ProductsModule must be lazy loaded -> prefix: 'products'.
- Validators module: The custom validators go here (import them in the products module).
